1 The hybrid superstring in an $AdS_2 \times S^2$ background

Superstring $AdS_2 \times S^2$ can be considered as the non-linear sigma model with a Wess-Zumino-Witten (WZW) term :

$$\frac{PSU(1,1|2)}{U(1) \times U(1)}$$

The element of $psu(1,1|2)$

$$G = \begin{pmatrix} A & X \\ Y & B \end{pmatrix}, \quad \begin{matrix} str M = tr A - tr B = 0 \\ HG + G^\dagger H = 0 \end{matrix}, \quad H = \begin{pmatrix} \sigma_3 & 0 \\ 0 & -\mathbb{I} \end{pmatrix}. \quad (1)$$

The \mathbb{Z}_4 automorphism Ω :

$$\Omega(G) = \begin{pmatrix} JA^T J & -JY^T J \\ JX^T J & JB^T J \end{pmatrix}, \quad J = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}. \quad (2)$$

$$\mathcal{G} = \mathcal{H}^0 \oplus \mathcal{H}^1 \oplus \mathcal{H}^2 \oplus \mathcal{H}^3, \quad \Omega(H^p) = i^p H^p. \quad (3)$$

Here $\mathcal{H}^0 = u(1) \times u(1)$, \mathcal{H}^2 even, $\mathcal{H}^1, \mathcal{H}^3$ odd.

$$[H^p, H^q] \in \mathcal{H}^{p+q} \pmod{4}. \quad (4)$$

The action

$$S_{AdS} = S_{GS} + \int d^2z (d_\alpha J_-^\alpha + \hat{d}_{\hat{\alpha}} J_+^{\hat{\alpha}} - \frac{1}{2} d_\alpha \hat{d}_{\hat{\beta}} F^{\alpha\hat{\beta}}) + S_{com} + S_{ghost} \quad (5)$$

$$= \int d^2z \left[\frac{1}{2} \eta_{cd} J_+^c J_-^d - \frac{1}{4} \delta_{\alpha\hat{\beta}} (J_+^\alpha J_-^{\hat{\beta}} - J_-^\alpha J_+^{\hat{\beta}}) \right] \\ + \int d^2z (d_\alpha J_-^\alpha + \hat{d}_{\hat{\alpha}} J_+^{\hat{\alpha}} - \frac{1}{2} d_\alpha \hat{d}_{\hat{\beta}} F^{\alpha\hat{\beta}}) + \\ + S_{com} + S_{ghost}. \quad (6)$$

where $J_\pm^A = (g^{-1} \partial_\pm g)^A$, $g \in \frac{PSU(1,1|2)}{U(1) \times U(1)}$, $A = (cd, c, \alpha, \hat{\alpha})$

$F^{\alpha\hat{\beta}}$ is constant RR flux $F^{\alpha\hat{\beta}} = -2\delta^{\alpha\hat{\beta}}$. d_α and $d_{\hat{\alpha}}$ are auxiliary fields.

Integrated out the auxiliary fields

$$d_\alpha = \delta_{\alpha\hat{\beta}} J_+^{\hat{\beta}}, \quad \hat{d}_{\hat{\beta}} = -\delta_{\alpha\hat{\beta}} J_-^\alpha.$$

$$\begin{aligned} S_{AdS} &= \int d^2z \left[\frac{1}{2} \eta_{cd} J_+^c J_-^d - \frac{1}{4} \delta_{\alpha\hat{\beta}} (J_+^\alpha J_-^{\hat{\beta}} + 3J_-^\alpha J_+^{\hat{\beta}}) \right] + S_{com} + S_{ghost}, \\ &= \int d^2z \left[\frac{1}{2} \text{str}(J_+^2 J_-^2) + \frac{1}{4} \text{str}(J_-^3 J_+^1) + \frac{3}{4} \text{str}(J_+^3, J_-^1) \right] + S_{com} + S_{ghost}. \end{aligned} \quad (7)$$

Where the currents J_\pm^p , ($p = 0, 1, 2, 3$) is given by

$$\begin{aligned} J_\pm^0 &= J_\pm^{cd} T_{cd}, & J_\pm^1 &= J_\pm^\alpha T_\alpha, \\ J_\pm^2 &= J_\pm^c T_c, & J_\pm^3 &= J_\pm^{\hat{\alpha}} T_{\hat{\alpha}}, \end{aligned} \quad (8)$$

Considering the variation of the group element g as $\delta g^{-1} g = \delta X = \delta X^{(0)} + \delta X^{(1)} + \delta X^{(2)} + \delta X^{(3)}$, the variation of the current $J = g^{-1} dg$ reads

$$\begin{aligned} \delta J_\pm^0 &= \partial_\pm \delta X^0 + [J_\pm^0, \delta X^0] + [J_\pm^1, \delta X^3] + [J_\pm^2, \delta X^2] + [J_\pm^3, \delta X^1], \\ \delta J_\pm^1 &= \partial_\pm \delta X^1 + [J_\pm^0, \delta X^1] + [J_\pm^1, \delta X^0] + [J_\pm^2, \delta X^3] + [J_\pm^3, \delta X^2], \\ \delta J_\pm^2 &= \partial_\pm \delta X^2 + [J_\pm^0, \delta X^2] + [J_\pm^1, \delta X^1] + [J_\pm^2, \delta X^0] + [J_\pm^3, \delta X^3], \\ \delta J_\pm^3 &= \partial_\pm \delta X^3 + [J_\pm^0, \delta X^3] + [J_\pm^1, \delta X^2] + [J_\pm^2, \delta X^1] + [J_\pm^3, \delta X^0]. \end{aligned} \quad (9)$$

The equations of motion

$$\frac{1}{2}D_+J_-^3 + \frac{3}{2}D_-J_+^3 = -\frac{1}{2}[J_+^2, J_-^1] - \frac{1}{2}[J_+^1, J_-^2], \quad (10)$$

$$\frac{3}{2}D_+J_-^1 + \frac{1}{2}D_-J_+^1 = \frac{1}{2}[J_+^2, J_-^3] + \frac{1}{2}[J_+^3, J_-^2], \quad (11)$$

$$D_+J_-^2 + D_-J_+^2 = -[J_+^1, J_-^1] + [J_+^3, J_-^3], \quad (12)$$

where $D_\pm = \partial_\pm + [J_\pm^0, \]$.

The Maurer-Cartan equations $\partial_+J_- - \partial_-J_+ + [J_+, J_-] = 0$ can be rewritten as

$$\partial_+J_-^0 - \partial_-J_+^0 = -[J_+^0, J_-^0] - [J_+^1, J_-^3] - [J_+^2, J_-^2] - [J_+^3, J_-^1], \quad (13)$$

$$D_+J_-^3 - D_-J_+^3 = -[J_+^1, J_-^2] - [J_+^2, J_-^1], \quad (14)$$

$$D_+J_-^1 - D_-J_+^1 = -[J_+^2, J_-^3] - [J_+^3, J_-^2], \quad (15)$$

$$D_+J_-^2 - D_-J_+^2 = -[J_+^1, J_-^1] - [J_+^3, J_-^3]. \quad (16)$$

2 The twisted duality and Lax connection

Hodge star of the bosonic currents

$$\star J_i = g_{ik} \epsilon^{kj} J_j, \quad (20)$$

or

$$\begin{aligned} \star J_+ &= \frac{1}{2}(\star J_\tau + \star J_\sigma) = J_+, \\ \star J_- &= \frac{1}{2}(\star J_\tau - \star J_\sigma) = -J_-. \end{aligned} \quad (21)$$

The currents J^0 is invariant at the Hodge star. The Hodge star of the fermionic currents

$$\star J_i^\alpha = g_{ik} \epsilon^{kj} J_j^\alpha, \quad (22)$$

or

$$\star J_\pm^{1,3} = \pm J_\pm^{1,3}, \quad (23)$$

Define a duality transformation

$$J_{\pm}^a \rightarrow i^{\frac{a}{2}} \star J_{\pm}^a, \quad a = 1, 2, 3 \quad (24)$$

The MCE's will be derived easily from the equations of motion EOM's, moreover, the reverse is also true by the same transformation.

Introduce twisted duality transformations

$$\begin{aligned} \mathcal{J}_i^0(\lambda) &= J_i^0, \\ \mathcal{J}_i^2(\lambda) &= \frac{1}{2}(\lambda^2 + \lambda^{-2})J_i^2 + \frac{1}{2}(\lambda^2 - \lambda^{-2}) \star J_i^2, \\ \mathcal{J}_i^1(\lambda) &= \frac{1}{2}(\lambda + \lambda^{-3})J_i^1 + \frac{1}{2}(\lambda - \lambda^{-3}) \star J_i^1, \\ \mathcal{J}_i^3(\lambda) &= \frac{1}{2}(\lambda^3 + \lambda^{-1})J_i^3 + \frac{1}{2}(\lambda^3 - \lambda^{-1}) \star J_i^3, \end{aligned} \quad (25)$$

satisfying MCE, and recovering the above duality transformation ($\lambda^2 = i$).

The hybrid superstring ...
Integrability in γ -...

What is the meaning of the above relations?

$$\begin{aligned} J_i^{\prime\prime\alpha} &= -\sqrt{\lambda} r_i^2 \gamma^{\alpha\beta} \partial_\beta \phi_i^{\prime\prime}, \\ J_1^\alpha &= -\sqrt{\lambda} r_1^2 \gamma^{\alpha\beta} G(\partial_\alpha \phi_1 - \hat{\gamma} r_2^2 \gamma_{\alpha\beta} \epsilon^{\beta\gamma} \partial_\gamma \phi_2), \\ J_2^\alpha &= -\sqrt{\lambda} r_2^2 \gamma^{\alpha\beta} G(\partial_\alpha \phi_2 + \hat{\gamma} r_1^2 \gamma_{\alpha\beta} \epsilon^{\beta\gamma} \partial_\gamma \phi_1). \end{aligned} \quad (37)$$

The $U(1)$ currents of strings on S^2 are equal to those on the γ -deformed background. i.e.

$$J_i^{\prime\prime\alpha} = J_i^\alpha. \quad (38)$$

3.2. TsT transformation on AdS^2

$$g = \begin{pmatrix} r_1 e^{i\phi_1''} & r_2 e^{i\phi_2''} \\ r_2 e^{-i\phi_2''} & r_1 e^{-i\phi_1''} \end{pmatrix}, \quad r_1^2 - r_2^2 = 1, \quad g_{ij} = \text{diag}(r_1^2, -r_2^2) \quad (39)$$

The string action on AdS^2

$$S'' = -\frac{\sqrt{\lambda}}{2} \int d\tau \frac{d\sigma}{2\pi} [\gamma^{\alpha\beta} (\partial_\alpha r_1 \partial_\beta r_1 - \partial_\alpha r_2 \partial_\beta r_2 + g_{ij} \partial_\alpha \phi_i'' \partial_\beta \phi_j'') + \Lambda(r_1^2 - r_2^2 - 1)] \quad (40)$$

Here, λ is same as in S^2 case excepting the radius R of AdS_2 .

4 Integrability in γ -deformed backgrounds

The sigma model on S_2 (or AdS^2) follows from the usual action for the principal chiral field:

$$S = \int dz_+ dz_- \text{tr}(J_+ J_-), \quad J_{\pm} = g^{-1} \partial_{\pm} g \quad (44)$$

EOM and MCE are

$$\partial_+ J_- + \partial_- J_+ = 0, \quad \partial_+ J_- - \partial_- J_+ + [J_+, J_-] = 0. \quad (45)$$

Now the Lax connection $A_i(l)$ with the spectral parameter λ is constructed,

$$A_{\pm} = a_{\pm}(l) J_{\pm} = \frac{\mp l}{1 \mp l} J_{\pm}, \quad [D_+, D_-] = 0. \quad (46)$$

How to define the Lax connection on the γ -deformed background?

$$g(r_i, \phi_i'') = M_+(\phi_i'') \hat{g}(r_i) M_-(\phi_i''), \quad (47)$$

$$M_{\pm} = \begin{pmatrix} 0 & e^{\frac{i}{2}(\phi_2'' \pm \phi_1'')} \\ e^{-\frac{i}{2}(\phi_2'' \pm \phi_1'')} & 0 \end{pmatrix}, \quad M' = \begin{pmatrix} 0 & e^{\frac{i}{2}(\phi_1'' + \phi_2'')} \\ e^{-\frac{i}{2}(\phi_1'' + \phi_2'')} & 0 \end{pmatrix} \quad (48)$$

we get

$$J_{\pm}(r_i, \phi_i'') = M^{-1} \hat{J}_{\pm}(r_i, \partial \phi_i'') M, \\ \hat{J}_{\pm} = \frac{i}{2}(\partial_{\pm} \phi_2'' - \partial_{\pm} \phi_1'') \sigma_3 + \hat{g}^{-1} \partial_{\pm} \hat{g} - \frac{i}{2}(\partial_{\pm} \phi_1'' + \partial_{\pm} \phi_2'') \hat{g}^{-1} \sigma_3 \hat{g}. \quad (49)$$
